Table 2. Allocation and within-allocation outcomes of the novelty reservation

Ranking	Allocation task-link gain	Within-allocation task-link gain	Within-allocation unfamiliar exposure	Within-allocation general-reach gain	Reproduced task-link share
Primary	+1.396	+0.051	+3.697	+0.295	96.5%
Alternative	+1.157	+0.230	+3.146	+0.152	83.4%

Note. Means per 30-document list over the same 356 situations. Allocation contrasts compare the coverage match with baseline; within-allocation contrasts compare the novelty reservation with its coverage match. Unfamiliar exposure counts documents with an unseen core combination, not unique combinations. General reach counts documents cited by at least two external organizations. Task-linked event totals are 921/1,418/1,436 under baseline/match/novelty for the primary ranking and 1,050/1,462/1,544 for the alternative. Reproduced shares are 497/515 and 412/494. Each policy supplies 10,680 document occurrences. Repeated document selections remain separate events. The matched lists preserve the novelty lists' core counts and all noncore identifiers.
