Table 3. Actual novelty exchanges at nine task positions

Task and ranking	Binding screens	Introduced documents	Net task links per introduced document	Net general reach per introduced document
Battery, primary	56/356	89	−0.056	−0.112
Battery, alternative	36/356	47	−0.170	−0.128
Electronics, primary	45/1077	58	+0.103	−0.069
Electronics, alternative	14/1077	15	−0.133	−0.200

Note. N(9,3) versus B(9), with equal core positions and noncore identifiers. Binding is defined by the unfamiliar shortfall at origin, not by subsequent links. The ratios divide net linked-document gains, after subtracting removed documents, by introduced document events. They are not citation counts or unique inventions. All nonbinding lists remain identical; full all-screen, binding and nonbinding estimates, organization ranges and crossed sensitivities are retained in the supplement.
