Table 4. Proposed routes from shortlist to technical assessment

Route	Evidence packet	Next assessment	Gate for the current task
Direct function	Documented task object and thermal path; disclosed interfaces and limits; missing conditions flagged	Task engineer checks contact, insulation, leakage and operating envelope	Advance to technical feasibility review when the documented function matches the need
Mechanism analogy	Documented source function; candidate transferable principle; differences in medium, geometry and conditions	Appropriate specialist identifies adaptations and requirements for the target application	Advance as an adaptation question, with unresolved transfer conditions recorded
Unsupported match	Text showing a different object or function; no task-relevant transfer principle identified in the text examined	Analyst records the mismatch and checks any separate documented justification	Close the current task track unless further text establishes a relevant function or transfer principle
Unresolved evidence	Missing function or thermal path; exact text or claims required to decide	Analyst retrieves the specified description or claims, or defers the candidate	Keep unresolved until sufficient evidence supports another route

Note. Routes are proposed evidence and action states illustrated by historical desk assessment. They are not measured classification accuracies, expert endorsements or tested staffing arrangements. An organization's distribution of the analyst and reviewer responsibilities may vary.
